SolidLab highlights

The **technical** perspective

Pieter Colpaert (IDLab – UGent)

And

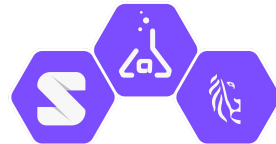

Vincent Naessens (DistriNet – KU Leuven)

Beatriz Esteves (IDLab – UGent)

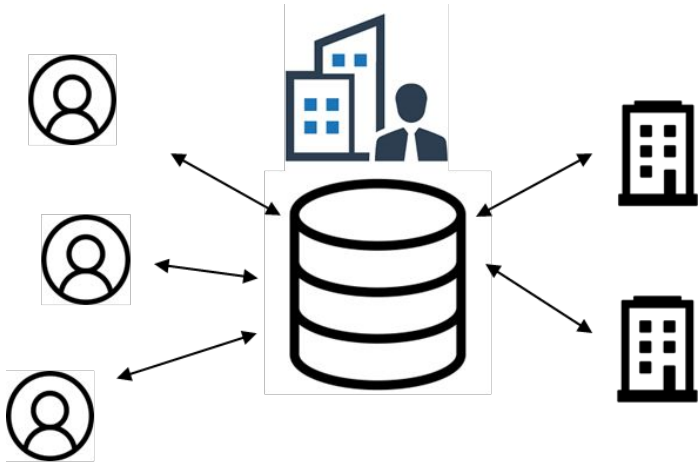

Vincent Naessens

KU Leuven – Distrinet

Complex security challenges

*Massive amounts of data
managed by
Limited number of tech providers*

Emerging amount of data breaches

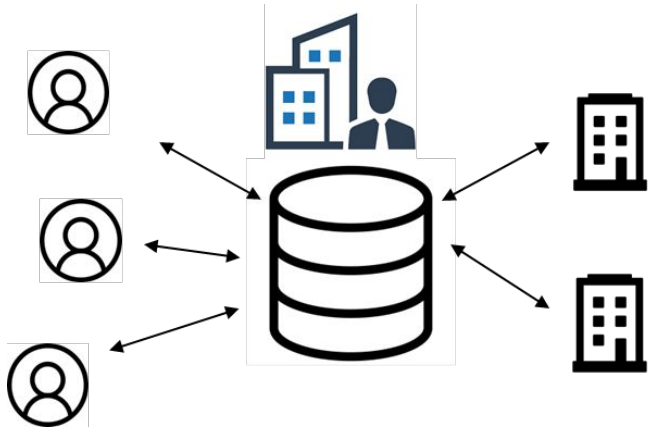

- “data sources become honeypots”
- Stealing sensitive data || ransomware
- Impact can often not be undone
- *Data protection*

Semi-trusted platform providers

- “Honest-but-curious entities”
- Surveillance || prior knowledge
- Leaking data to intelligence agencies
- *Data sovereignty*

Solution space – data protection

Controlled access to data (data at rest)

- Authentication and Access control
- Cryptographic technologies

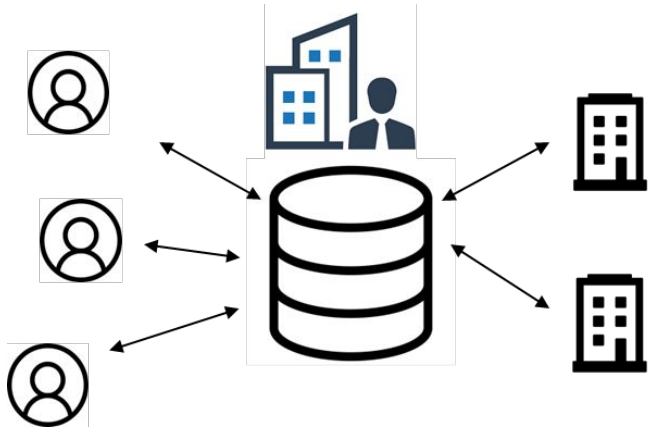

Controlled processing (data in use)

- Trusted execution environments (TPM...)
- Processing on encrypted data

Secure communication (data in transit)

Solution space – controlling data flows

Advanced data collection strategies

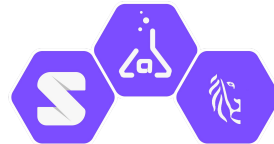

- Local data management
- Pseudonymous data pods
- Decentralized data management

Controlling data retention

Transforming data over time

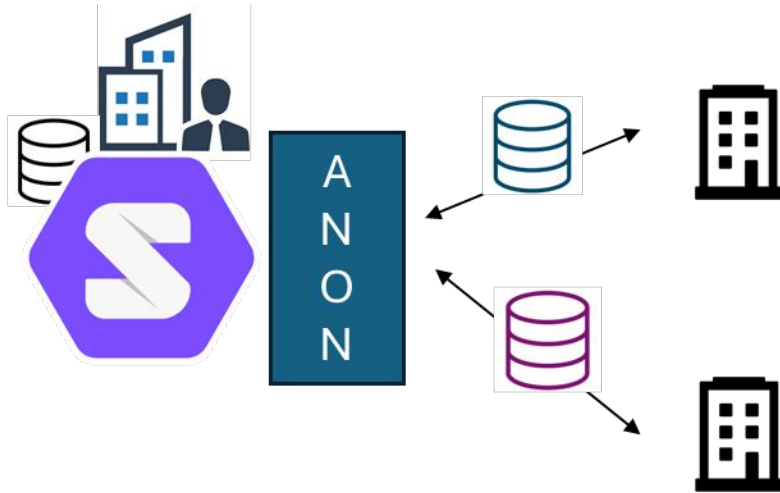

Controlled release of sensitive data

- Privacy-friendly queries (pull based)
- Dataset anonymizations (push based)

Example 1:

Collective anonymous release of pods for research purposes

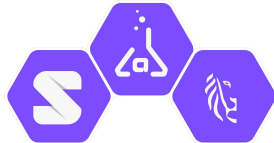

Non-perturbative techniques

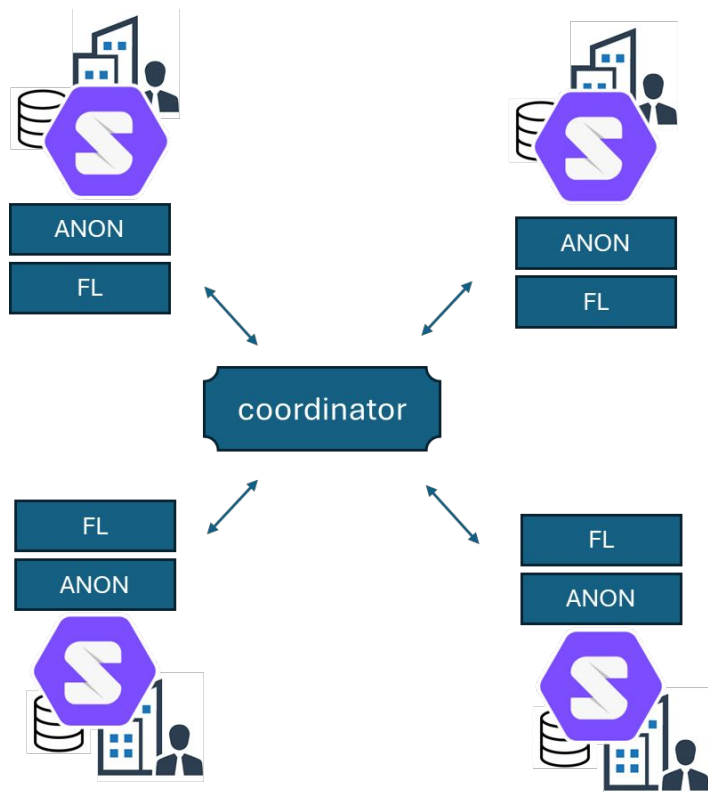

- Generalization
- Sampling
- Outlier suppression

Perturbative techniques

- Randomization
- Data swapping
- Noise addition

Example 2: Federated learning with Solid

ANON

transforms data from multiple pods locally until a k-anonymity and l-diversity level is reached

FL

builds a local model based on anonymized data

Coordinator

builds a resulting model based on local models

We build **software**,

implementing **specifications** and
standards we also contribute to.

We publish our **research** findings.

Community Solid Server

<https://github.com/CommunitySolidServer>

A community storage implementation that became *the* reference implementation.

Allows to experiment with new features: ideal playground for **W₃C LWS** and **W₃C Solid**

The basis is stable and will be further maintained by IDLab.

Fork 144 Starred 572

Contributors 51

[+ 37 contributors](#)

Comunica

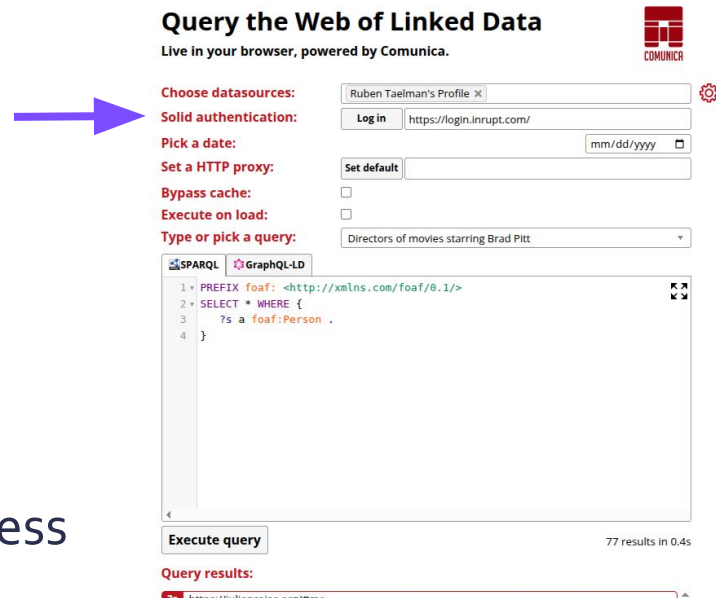

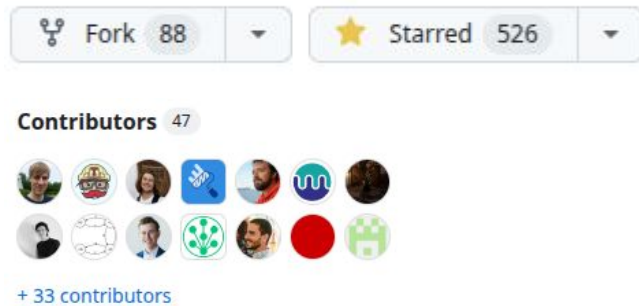

<https://comunica.dev>

The client-side query engine was extended with Solid auth support.

It's a playground for **W₃C SPARQL** and new data architecture paradigms.

The project will be further developed in follow-up projects.

There's a demo
– see minute madness

RML: mapping data to a Knowledge Graph

<https://rml.io/>

Allows to **transform** and share **existing data**,
from existing data management systems (RDB, API, ...),
using the Solid protocols.

Our implementations are a playground for **W3C Knowledge Graph Construction**

During SolidLab,

- Integration with Solid APIs and VC generation was introduced
- An algebraic foundation was formalized and implemented
- Feature extensions were researched
 - **incRML**: always up-to-date knowledge graphs
 - **Logical Views**: abstraction layer to merge any type of (deeply nested) source data

Fork 66 Starred 187

EYE reasoner

<https://github.com/eyereasoner>

Interoperable **logic** on Web-scale

Essential for:

- proving something is true
- knowledge engineering
- validation
- ...

It was applied in SHARCS, and is the basis for our work on a policy engine.

Fork 19

Starred 156

Contributors 8

And much more

<https://github.com/solidlabresearch>

= a treasure trove for Solid developers for:

- Aggregating,
- stream reasoning,
- authorization with ODRL policies,
- etc.

Impact starts with a specification

RDF, SPARQL 1.2, RML, Triple Pattern Fragments, the Solid specifications, Linked Web Storage (LWS), Verifiable credentials, RDF Stream Processing, Linked Data Event Streams (SEMIC), SHACL, ODRL, Framework for ODRL Rule Compliance through Evaluation (FORCE), Data Privacy Vocabulary, DCAT-AP Feeds (SEMIC), Various OSLO Flanders specifications (Flanders), CPSV-AP, RDF Time Series Snippets, TREE hypermedia, Event Notifications, Shape Indexes, the function ontology, Incremental RML, Authorization for Dataspaces, Yarrml, Notation3, Time Functions, DCAT-AP, ...

We maintain a full list of specifications we build, contribute to, or endorse at <https://spec-catalogue.knows.idlab.ugent.be/>

Towards enterprise: Kvasir

<https://kvasir.pages.ilabt.imec.be/kvasir-server/what-is-kvasir.html>

A microservices architecture for high throughput writing
preparing data for specialized read interfaces.

Seeks compliance with the relevant parts of S3, Solid and (soon) Linked Web Storage.

Decouples authorization from storage
→ *bring your own authorization server*

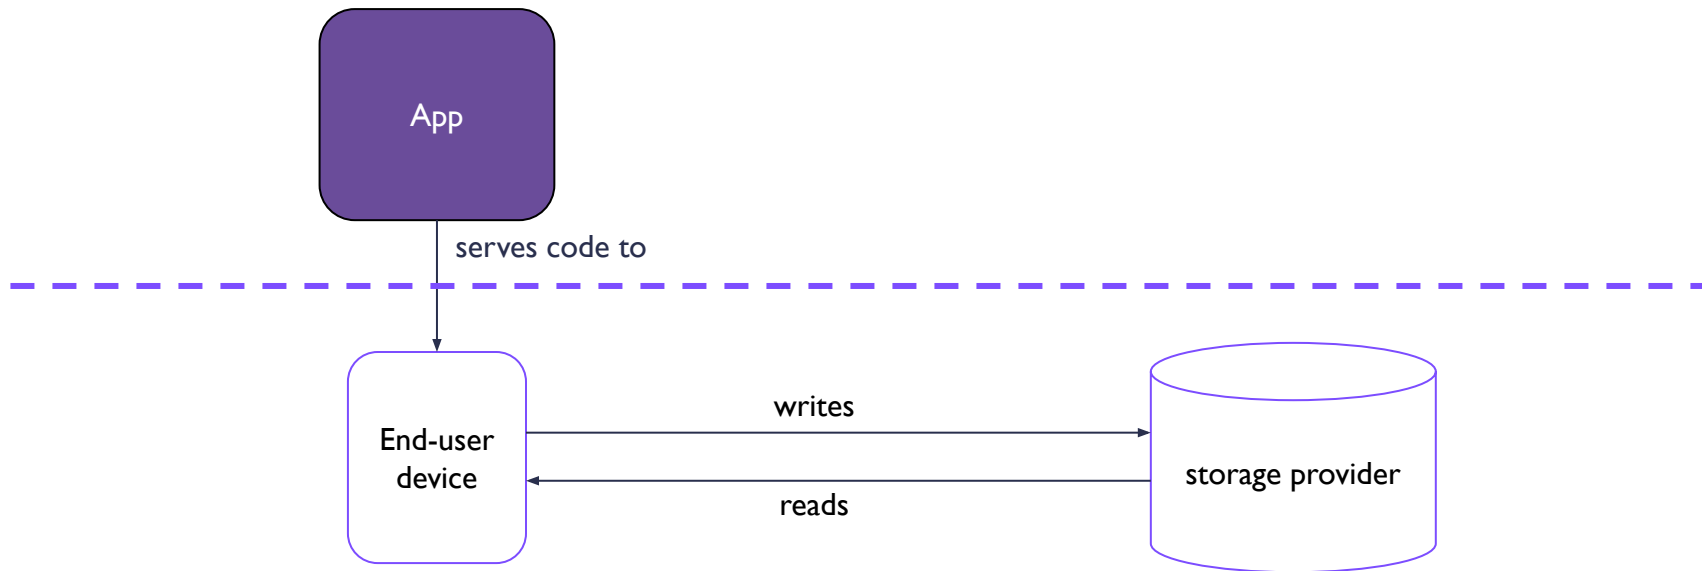

Specialized read interfaces for:

- GraphQL-based subsets
- Time series
- Assets
- ...

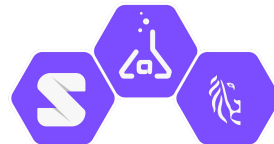

Solid separates data from apps

2021

New opportunities for

1. redefining our relation to app builders
2. simplifying legal compliance and putting the user *in control*

We need more than just storing a file

What's in a Pod?

A knowledge graph interpretation for the Solid ecosystem

The Solid vision aims to make data independent of applications through technical specifications, which detail how to publish and consume permissioned data across multiple autonomous locations called “pods”. The current document-centric interpretation of Solid, wherein a pod is a single hierarchy of Linked Data documents, cannot fully realize this independence. Applications are left to define their own APIs within the Solid Protocol, leading to fundamental interoperability problems and the need for associated workarounds. The long-term vision for Solid is confounded with the concrete HTTP interface to pods today, leading to a narrower solution space to address core issues. We examine the mismatch between the vision and its prevalent document-centric interpretation, and propose a reconciliatory graph-centric interpretation wherein a pod is a hybrid, contextualized knowledge graph. In this article, we contrast the existing and proposed interpretations in terms of how they support the Solid vision. We argue that the graph-centric interpretation can improve pod access through different Web APIs that act as views into the knowledge graph. We show how the latter interpretation provides improved opportunities for storage, publication, and querying of decentralized data in more flexible and sustainable ways. These insights are crucial to reduce the dependency of Solid apps on implicit API semantics and local assumptions about the shape and organization of data and the resulting performance. The suggested broader interpretation can guide Solid through its evolution into a heterogeneous yet interoperable ecosystem that better supports the diverging read/write data access patterns of different use cases.
